Category:French films Category:2008 films Category:French fantasy films Category:Pirate films Category:Films set in France Category:2000s fantasy filmsABSTRACT Tuberculosis (TB) remains the leading infectious cause of death worldwide, with 8.8 million new cases and 1.3 million deaths in 2014. The HIV epidemic in Eastern Europe has increased TB rates, particularly in countries with weak TB control systems. Several studies have demonstrated the synergistic effect of the HIV/TB co-infection; however, the prevalence of HIV infection in TB patients has not yet been well defined in these countries. Here, we will address this important gap by assessing the burden of the HIV/TB co-infection at a country level in Eastern Europe and Central Asia (EECA), where 60% of the world's population resides, based on the 2013 TB and HIV Epidemiological Models (IHME). Using innovative modeling approaches and analysis, we will identify the prevalence of the HIV/TB co-infection and understand how to best mitigate the effects of HIV infection on the overall TB burden. To define the impact of HIV/TB co-infection on the overall TB burden, we will first develop the country-level HIV/TB epidemics and then examine the impact of the HIV epidemic on the TB burden. We will next examine the impact of HIV/TB co-infection on individual risk of developing TB, as well as on TB- and HIV-related mortality. Finally, we will evaluate the impact of high-risk behavior, such as smoking, which is highly prevalent in TB patients, on HIV infection. The prevalence of HIV infection and the synergy between the two diseases will be analyzed by various demographics and characteristics, including sex, age, region, country income, rural or urban residence, region of residence, region of birth, country of residence, ethnicity and educational level. We will then use the projected TB and HIV epidemics to generate estimates of the number of individuals with HIV/TB co-infection and the number of TB cases, TB deaths and deaths from HIV/AIDS attributable to the HIV/TB co-infection. The results of this study will have a significant positive impact on the TB epidemic in EECA, and will lead to recommendations for TB programs on how to improve case detection of TB among HIV-infected individuals.The U.S. economy will continue to grow and expand, but it's far from a "V.C.
