Psychometric Properties of Markov Chain Monte Carlo Algorithms for Bayesian Inference with Conditional Normal and Student-t Distributions A: I think the most efficient, free, and relevant search engine I've seen is skimlinks.com. You search with either one of the words, "applied linear statistical models" or "applied linear regression models" and it will return the entire body of the site (the search results page) containing every single reference that you might want. There is a human that will take your keyword and search the entire web site for you, and post a summary of the results in a second page. I wish they had done that on this question, so that we wouldn't have to read all the answers in order to discover the reference. It is quite a comprehensive search. A: For the "reader" (or searcher) who is not interested in the answers, but just wants the references, I recommend skimlinks.com 1. Field of the Invention The present invention relates to a flip-flop memory circuit and a method of data writing and reading thereof. More particularly, it relates to a flip-flop memory circuit which can be used for processing a large amount of data at high speed and a method of data writing and reading thereof. 2. Description of the Prior Art In the field of electronic circuits, flip-flop memories are widely used. These memories are indispensable to logic circuits, because they can directly access memory cells in response to address signals to store and read out data. Among these memories, there are nonvolatile memories which can maintain data stored even when power is turned off. These memories are called as "nonvolatile memories" which can maintain data even when power is turned off. These nonvolatile memories are classified into two types; a first type is a memory circuit of the type in which data is permanently stored by means of a charge storing region in a capacitor or
