In my web application, I'm using Spring's Data to persist my code. The approach seems a bit backwards to me but I'm open to hear your opinions. Currently, I have a service that retrieves data from the database. The service itself is tested using a mock repository, which is a mock of an interface to the repository. From there, I can perform REST calls with the mock repository in order to return mock data. And the mock data is used to verify my service does what I expected. I'm wondering if this is the best way to test a service that has a dependency on a DAO. Do you have any suggestions? A: You can use a mock database to test your DAO classes. For example, if your DAO has a method that inserts into the database, you could use Mockito to do this with a mocked database. If you know your tests are doing pretty much the same thing, the test code should be separated out. You don't want to test DAO classes in the same test suite that tests your service logic. A: Your unit tests with the real database can be as simple as:

```
@RunWith(SpringJUnit4ClassRunner.class) @ContextConfiguration(classes =
DataHandlerConfig.class) @Transactional public class DataHandlerTest { @Autowired
private DataHandler dataHandler; @Autowired private TransactionalDatabaseTemplate
databaseTemplate; @Before public void setup() { databaseTemplate.startDb(); } @Test
public void testInsertIntoDatabase() { f30f4ceada
