Exemplary embodiments relate to an apparatus and method for recording/reproducing an image and, more particularly, to an apparatus and method for recording/reproducing an image using a transparent image data obtained by synthesizing data in an image frame. In most current digital recording/reproducing apparatuses, a method of recording and reproducing an image by using a black image and a white image in a complementary manner is adopted. However, since the black image and the white image of the complementary color scheme are written together, a problem may be caused in that fine balance between a gamma curve and a gray characteristic may be hard to obtain. Accordingly, in the case of an image of a film, a gray characteristic may be hard to obtain due to insufficient resolution of the image. To address these shortcomings, there is provided a method of recording an image by rendering a transparent image. That is, when an image in which an image frame and a background frame are displayed alternatively is recorded on a recording medium, for example, a print medium, by using a transparent recording method (or a transparent image recording method), the background frame may be easily displayed when the image frame is recorded on the recording medium. Accordingly, in the transparent image recording method, since a gray image, which is an image recorded by the complementary color scheme, can be rendered, fine balance between a gamma curve and a gray characteristic can be easily obtained. The transparent image recording method may be performed by synthesizing image data in the image frame with image data of an area (or a background frame) outside the image frame in units of image. In this respect, the transparent image recording method may be expressed by using an equation as shown in Equation 1 below. b i

A: A java media framework would provide the base classes required to play, modify, handle, structure and possibly compress and decompress audio (or other digital media). A java audio framework would offer a set of classes, some of which may be used to get access to the standard media framework and some that may be used for building your own applications. It is quite possible for an implementation of a sound card driver and a reference implementation to be implemented by the same group of people, as they share much the same infrastructure. \*t + 2/3\*t\*\* f30f4ceada
